## User Guide

### Use:

For attracting attention on the surface the BUDDY **Blast** is a high volume, emergency air horn. It is not designed to operate underwater.

### Connection:

The **Blast** is designed to sit in-line between the first stage pressure reducer and the AP Diving buoyancy compensator inflator. Both Auto Air and standard connections are available.

The **Blast** comes with a 64cm (24") hose to connect the Blast to a low pressure port on a first stage, not exceeding 14 bar. The female connector on the Blast fits to either the Auto Air or standard inflator, depending which type you have on your buoyancy compensator.

### Operation:

No Buttons - Just Squeeze

The **Blast** is designed so that divers can operate it easily with cold hands or gloves in an emergency. There are no buttons to locate just grip the body of the unit and squeeze.

### Volume:

The Blast can produce up to 130dB. Hold and point away from ears during operation!. Do Not use unless necessary.

**WARNING: KEEP OUT OF REACH OF CHILDREN**
